

# Risk Rating of TEN-T Core Road Network in Greece

This map shows the statistical risk of death per billion vehicle kilometre on TEN-T Core Road Network in Greece. The crash rate for these roads is indicated in the bandings shown. The risk is calculated by comparing the frequency of fatal crashes on every stretch of road with how much traffic each road is carrying.

For more information on the statistical background to this research, visit the EuroRAP website at [www.eurorap.org](http://www.eurorap.org).

### Legend

Fatal crashes per billion vehicle kilometers travelled

- Low risk
- Low - medium risk
- Medium risk
- Medium - high risk
- High risk

- Motorway
- Single / mixed road
- Other roads
- International boundary

0 20 40 60 80 100 Km.

© EuroRAP AISBL 2020. This map was produced for RSI 'Panos Mylonas' to EuroRAP/IRAP protocols. The map is produced as part of the SLAIN - Saving lives assessing and improving TEN-T road networks safety - project co-financed by the Connecting Europe Facility of the European Union. Crash information is for 2015-2018, the most recent available when the map was prepared. Traffic data is the average for 2015-2018. No results are presented for roads in grey. Data: Ministry of Infrastructure and Transport, Hellenic Statistical Authority. The network presented and rated here is relevant to the period 2015-2018.
